Appears in Collections: [Ohio State Engineer: Volume 15, no. 5 \(March, 1932\)](#)

In the Mill and on the Firing Line

... LINDE PROCESS SERVICE ASSURES DEPENDABLE PIPE WELDS

IN construction of pipe lines in the field or double lengthing of pipe at the mill Linde Process Service can provide invaluable assistance in organizing welding operations for maximum speed, economy and dependability.

Step by step, from mobilization, training and testing of welders this service follows through to the final testing of the completed line. It effectively supplements the work of the customers' own engineers . . . it focuses upon their problems the wealth of welding experience Linde has gained from two decades of pioneering in the pipe line field . . . and it translates proved methods and well established laboratory findings into terms of actual field operation.

Tomorrow's engineers will be expected to know how to apply the oxy-acetylene process of welding and cutting metals. For their assistance, we have prepared several interesting technical booklets explaining how this modern metal-working process is used in the design, construction, and fabrication of metal parts and structures. These books contain newer and more practical material than most texts and will form a helpful addition to your personal library. Write to us and we will send them to you without charge.

THE LINDE AIR PRODUCTS COMPANY

Unit of Union Carbide and Carbon Corporation

126 Producing Plants

627 Warehouse Stocks

IN CANADA, DOMINION OXYGEN COMPANY, LTD., TORONTO

SEALING STEEL

WITH FLUID COPPER

WITH copper melted to the consistency of kerosene in an electric furnace, steel can be sealed so as to be gas-tight. Like bones, the grains of steel tend to grow together slowly, but electric heat speeds up the process so that steel joints require but a few minutes to knit. And steel joints knit in a copper-brazing furnace are exceptionally neat, strong, and tight.

As a controlled atmosphere at very high temperature must be used, the electric furnace is important to the process. At brazing temperature, the molten copper wets the clean steel and flows into the

finest crevices, forming a copper-steel alloy which seals the joint. The greater the pressure at the joint, the readier the flow of copper.

Such furnaces are used in the manufacture of G-E refrigerators, where hundreds of evaporators are hermetically sealed daily.

These developments in industrial heating are largely the achievements of college-trained General Electric engineers. Newly graduated young men obtain in the Testing Department practical experience which fits them for future positions of responsibility.
